

ASSESSMENT SUMMARY

POSSIBLE CONDITION

Diabetic foot ulcer

CONFIDENCE

80.0%

RISK LEVEL

High Risk, due to signs of infection and possible complications

TOP MODEL PREDICTIONS

RANK	PREDICTED CONDITION	CONFIDENCE
1	Diabetic foot ulcer	80%
2	Infected wound	70%
3	Pressure ulcer	50%

CLINICAL GUIDANCE

Emergency / Urgency Guidance

Seek immediate medical attention due to signs of infection

AI-Generated Triage Notes

The image shows a foot with a large, open wound on the bottom, which appears to be a diabetic foot ulcer. The wound is deep, with exposed tissue and signs of infection, such as redness, swelling, and pus. There are also signs of poor circulation and possible neuropathy. The wound requires immediate medical attention to prevent further complications. General care includes keeping the wound clean and dry, and avoiding pressure on the affected area. Red flags include increased pain, swelling, or signs of infection. Consult a doctor immediately.
